# 1 Chapter 6: Cardinal Numbers and The Axiom of Choice

## 1.1 Material Notes

In the Book Page 134 to 135, while proving the case 1, the book mentioned

**Pigeonhole Principle:** No natural number is equinumerous to a proper subset of itself.

**Proof** Assume that  $f$  is a one-to-one function from the set  $n$  into the set  $n$ . We will show that  $\text{ran} f$  is all of the set  $n$  (and not a proper subset of  $n$ ). This suffices to prove the theorem. We use induction on  $n$ . Define:

$$T = \{n \in \omega \mid \text{any one-to-one function from } n \text{ into } n \text{ has range } n\}.$$

Then  $0 \in T$ ; the only function from the set  $0$  into the set  $0$  is  $\emptyset$  and its range is the set  $0$ . Suppose that  $k \in T$  and that  $f$  is a one-to-one function from the set  $k^+$  into the set  $k^+$ . We must show that the range of  $f$  is all of the set  $k^+$ ; this will imply that  $k^+ \in T$ . Note that the restriction  $f \upharpoonright k$  of  $f$  to the set  $k$  maps the set  $k$  one-to-one into the set  $k^+$ .

**Case 1** Possibly the set  $k$  is closed under  $f$ . Then  $f \upharpoonright k$  maps the set  $k$  into the set  $k$ . Then because  $k \in T$  we may conclude that  $\text{ran}(f \upharpoonright k)$  is all of the set  $k$ . Since  $f$  is one-to-one, the only possible value for  $f(k)$  is the number  $k$ . Hence  $\text{ran} f$  is  $k \cup \{k\}$ , which is the set  $k^+$ .

**[Ray's Note 1: Here the Case 1 should have more explanation:**

**We know that  $k$  is closed under  $f$  and  $\text{ran}(f \upharpoonright k) = k$ . Then why do we have  $\text{ran} f = k \cup \{k\}$ ? This is because of the following argument:**

**$f$  is one-to-one. We also know that  $k \notin k$  (otherwise we would form Russell's paradox). The preimage  $f^{-1}[\{f(k)\}]$  (the preimage of  $f(k)$  under  $f$ ) can only contain one element since  $f$  is one-to-one, and  $k \in f^{-1}[\{f(k)\}]$  because the preimage of  $f(k)$  must contain  $k$ . Thus,  $\text{ran} f = \text{ran}(f \upharpoonright k) \cup \text{ran}(f \upharpoonright \{k\}) = k \cup \{k\}$ . ]**

## 2 Ray's Notes Summary

[Ray's Note 1 (Page 2): Here the Case 1 should have more explanation:

We know that  $k$  is closed under  $f$  and  $\text{ran}(f \upharpoonright k) = k$ . Then why do we have  $\text{ran} f = k \cup \{k\}$ ? This is because of the following argument:

$f$  is one-to-one. We also know that  $k \notin k$  (otherwise we would form Russell's paradox). The preimage  $f^{-1}[\{f(k)\}]$  (the preimage of  $f(k)$  under  $f$ ) can only contain one element since  $f$  is one-to-one, and  $k \in f^{-1}[\{f(k)\}]$  because the preimage of  $f(k)$  must contain  $k$ . Thus,  $\text{ran} f = \text{ran}(f \upharpoonright k) \cup \text{ran}(f \upharpoonright \{k\}) = k \cup \{k\}$ . ]
